

CS 362 In-Class Exercise 4: Project Beta Testing

Your name: Kaitlyn McLaughlin

Project team number that you are testing (e.g., team 1): 20

PART-1: Organization and Purpose (2 pts)

Q1) Does the repository provide a README explaining the purpose of the software? If yes, based on reading that documentation, do you understand all the interesting features provided by the software? Do you have any advice to improve that documentation?

There are build instructions. I would recommend putting the platform-specific notes before the make instructions, as at that point, a user would be likely to run into errors if they didn't see the notes before trying to run the make.

PART-2: Installation and Setup (1 pts)

Q2) Is the documentation to install or setup the software available? (Note that for a web application, it would be a URL to access the website and instructions to host the website on a server). When following the instructions, do you face any difficulties while installing the software (accessing the URL for a website)? If yes, please explicitly state what issues you encountered, so that the project team can fix them.

NOTE: If you are testing a web application, then you do not need to set up a web server and try hosting the web application. Just go through the documentation to find out if it clearly explains the steps to host the website.

When attempting to run on a Windows system, the build instructions do not work. I attempted to use the g++ compiling command provided at the bottom of main.cpp, but that also did not work on my system. I was attempting to run it on Windows PowerShell. I'm not sure if it was a fault of my system, but at the very least, the instructions for a Windows application need to be updated.

I am going to be using my teammates Linux based application instead. The build worked properly with the provided instructions. However, as someone who does not use Linux frequently, it might not be the worst idea to include the whole command needed to download the libsfml-dev package for users who aren't as familiar with the system. Lastly, there are no instructions for how the player is supposed to move around. This isn't a huge problem if someone is used to different video game movement mechanics, but if someone isn't used to those, they might become confused about how to get their character to move around.

PART-3: Functional and Non-Functional Testing (2 pts)

Q3) Select a use case for the application-under-test and use your creativity to test the application in different possible ways. For example, if you are testing a login functionality, then test the sign up feature, sign in, adding invalid credentials, special characters, etc. Please provide the details of the use case you tested on the software by describing exactly what all you did and in what order? Make sure you are making notes while doing this. If you find any issues (e.g., something that was confusing, incorrect, or not working at all), please provide as many details as you can to replicate the issues so that the team can fix them.

When running the game, movement works properly, and the movement feels smooth. However, upon initiating a battle, the "Battle!" text did not appear and the screen was only a solid purple box. Additionally, there were several cases where, immediately after exiting the battle scene, without moving around, I was brought right back from the main world to the battle screen. This isn't technically one of your use cases, but it seems to indicate there is a chance that the user could get stuck in an endless battle loop with no means to escape.
