

CS 362 In-Class Exercise 4: Project Beta Testing

Your name: Max Leibowitz

Project team number that you are testing (e.g., team 1): 20

PART-1: Organization and Purpose (2 pts)

Q1) Does the repository provide a README explaining the purpose of the software? If yes, based on reading that documentation, do you understand all the interesting features provided by the software? Do you have any advice to improve that documentation?

The readme looks good to me, it's short but includes the needed information and links to other more comprehensive pages. I'm having kind of a hard time picturing the actual gameplay, so some screenshots might be helpful, but it's also hard to convey for a game.

PART-2: Installation and Setup (1 pts)

Q2) Is the documentation to install or setup the software available? (Note that for a web application, it would be a URL to access the website and instructions to host the website on a server). When following the instructions, do you face any difficulties while installing the software (accessing the URL for a website)? If yes, please explicitly state what issues you encountered, so that the project team can fix them.

NOTE: If you are testing a web application, then you do not need to set up a web server and try hosting the web application. Just go through the documentation to find out if it clearly explains the steps to host the website.

The setup documentation is pretty straightforward, especially for linux. I did have to install cmake, which wasn't mentioned, but that's a very common dependency so it's reasonable to expect it to be installed. I might still include an apt script to do it.

PART-3: Functional and Non-Functional Testing (2 pts)

Q3) Select a use case for the application-under-test and use your creativity to test the application in different possible ways. For example, if you are testing a login functionality, then test the sign up feature, sign in, adding invalid credentials, special characters, etc. Please provide the details of the use case you tested on the software by describing exactly what all you did and in what order? Make sure you are making notes while doing this. If you find any issues (e.g., something that was confusing, incorrect, or not working at all), please provide as many details as you can to replicate the issues so that the team can fix them.

None of the use cases appear to be implemented. The battle screen shows up, but it fails to load fonts (even after I added some in the location it was looking in), so it doesn't display or do anything. I asked and the battle system is also not implemented, the only thing missing on my end is some text. I wasn't able to get it to crash or produce any other error.

```
[BattleState] Exit Requested  
[WorldState] Wild encounter! Transitioning to battle...  
Failed to load font "assets/fonts/default.ttf" (failed to create the font face)  
Failed to load font "../assets/fonts/default.ttf" (failed to create the font face)  
Failed to load font "/System/Library/Fonts/Helvetica.ttc" (failed to create the font face)  
Failed to load font "C:/Windows/Fonts/arial.ttf" (failed to create the font face)  
Failed to load font "C:/Windows/Fonts/calibri.ttf" (failed to create the font face)  
WARNING: Failed to load battle font. Text will not display.
```
